PROFILE

Full stack developer with 6 years of experience shipping production systems end to end — React and TypeScript front ends, Java and Node.js services, and the Linux infrastructure underneath them. Most of that has been blockchain and fintech work, including the contract suite and Node.js tooling for a DeFi protocol live on 8 chains, with recent projects in self-hosted AI agent platforms. Comfortable owning a project from the first client conversation through to a hardened, documented, running server.

TECHNICAL SKILLS

Languages	TypeScript / JavaScript, Python, Java, Solidity, Rust
Frontend	React, Vite, Tailwind CSS, PostCSS, Shopify Liquid, HTML / CSS, responsive design
Backend	Node.js, Spring Boot 3, Flask, REST APIs, webhooks, MongoDB, SQLite (WAL), Redis
Infra / DevOps	Docker, Docker Compose, Caddy, DigitalOcean, AWS EC2, Heroku, Vercel, Linux hardening, cloud firewalls, GitHub Actions, pnpm, Nix
AI / LLM	Anthropic Claude API, Claude Code, MCP (Model Context Protocol) servers, agent orchestration, PyTorch, TensorFlow, OpenCV
Blockchain	Solidity, Hardhat, Foundry, Chainlink oracles, multi-chain EVM deployment, Ethers.js
Networking	MikroTik RouterOS, OpenWRT, TR-069 / GenieACS, dnsmasq, DNS & TLS (MTCNA certified)

EXPERIENCE

Full Stack Engineer — LockBox (self-hosted AI agent platforms) Apr 2026 – Present • Remote

- Built, deployed and handed off **two self-hosted agent-orchestration servers** on DigitalOcean — Ruflo, MCP, Docker Compose, Caddy and MongoDB — that the client now operates independently.
- Delivered **AgentXSD**, an autonomous software-development system that builds a multi-chain payment stack (policy engine, script compiler, ZKP circuits, SDKs) driven from a desktop client.
- Fixed runaway orchestration, where agents repeatedly re-assessed one another, with a run-control package: locked plans, retry caps and human approval gates between coding sessions.
- Hardened the deployment — IPv4-only networking, mode-600 secrets, internal-only MongoDB, Caddy path-prefix routing and backups — and shipped a desktop extension so a non-technical client could connect without touching the server.

Frontend Developer — React to Shopify Liquid Migration (Upwork) Feb 2026 • Remote

- Migrated a client's React / Vite / TypeScript storefront to a custom **Shopify Liquid** theme with GitHub-based deployment, preserving the design system in Tailwind CSS with a Vercel preview build.

Network Engineer — Ctrlbit (SD-WAN venture) Jun 2024 – Nov 2024 • Remote

- Stood up **GenieACS**, an open-source auto-configuration server managing routers remotely over TR-069 (Node.js, MongoDB, Redis); built dual-SIM failover that monitored SIM and WAN status and switched to the backup when the primary dropped.

Smart Contract & Backend Engineer — BankX Protocol (direct client contract) Oct 2021 – Present • Remote

- Ship and maintain the Solidity contract suite for a commodity-pegged stablecoin live on **8 EVM chains**, plus the Node.js tooling around it — including a CLI that reads live pool reserves and computes the rebalancing delta to restore the peg.
- Integrated Chainlink Price Feeds and Automation; diagnosed a production gas-limit bug causing reverts on Polygon when spot price drifted from the controller's moving average.
- Wrote and ran Foundry test suites reproducing external security-researcher submissions from the protocol's bug bounty; patched live exploit incidents within **6 hours** of detection.

Blockchain Developer — Nord Finance Jul 2021 – Sep 2021 • Remote

- Built automated test suites (Hardhat, Ganache, JavaScript) for the DeFi contracts behind interest-bearing savings products, covering deposits, withdrawals, yield accounting, access control and failure paths; set up local and mainnet-forked environments to reproduce production state.

Machine Learning Engineer — Appcilious Pvt. Ltd • GIEOM Jun 2020 – Sep 2020 • Bengaluru

- Built an AI background-removal web app (U-2-Net, Flask, Docker, Heroku, AWS EC2) at Appcilious, and a dlib-based face-alignment add-on for a KYC application at GIEOM where threading cut runtime by 3–4 seconds per run.

SELECTED WORK & OPEN SOURCE

- Java / Spring Boot 3** — built a webhook service on a DigitalOcean VPS ingesting live index-futures market signals for a trading client, with SQLite in WAL mode, a Caddy rate-limit plugin on the public endpoint and a Telegram notifier.
- OpenZeppelin/soroban-helpers #121, #122 — merged.** Separated build and simulate in TransactionBuilder; added Extend Footprint TTL support.
- NethermindEth/stellar-private-payments #200 — merged.** Embedded the Groth16 verification key into the verifier WASM at compile time. Further PRs open at smartcontractkit and ethereum-optimism.

EDUCATION & CERTIFICATION

B.Tech Computer Science — SRM Institute of Science & Technology, 2017–2021 • CGPA 7.8 | **MTCNA** certified, Oct 2024
